

Claim Amendments

Please amend the claims as set forth in the following listing. This listing of claims will replace all prior versions, and listings, of claims for the present application:

Claims:

1. (Currently amended) A hydration system for providing fluid to a user, comprising:
a bladder configured to hold a fluid, wherein bladder comprises an outer layer of fluorinated rubber composite and an inner layer of a material other than a rubber;
a spout connected to the bladder and in communication with the inside of the bladder, wherein the spout comprises an output port and a fill port for filling the bladder with fluid;
a cap adapted to engage and close the fill port;
a tube having a first end connected to the output port of the spout and having a second end connected to a fluid delivery fitting.
2. (Original) The system of claim 1, wherein the bladder is flexible.
3. (Currently amended) The system of claim 1 wherein the ~~bladder comprises an~~ inner layer is made of thermoplastic polyurethane.
4. (Original) The system of claim 1, wherein the cap is adapted to screw into the fill port.
5. (Original) The system of claim 1, wherein the spout has a width and a height, wherein the width is greater than height.
6. (Original) The system of claim 5, wherein the tube is made of flexible plastic.
7. (Original) The system of claim 1, wherein the fluorinated rubber composite comprises a polyamide reinforcing layer and a thermoplastic polymer layer.

Claims 8-15. Withdrawn.

16. (Currently amended) A method of storing a fluid, comprising:

at least partially filling the hydration system a fill port with a fluid, and closing the system by engaging the cap to the fill port, wherein the hydration system comprises:

a bladder configured to hold a fluid, wherein bladder comprises an outer layer of fluorinated rubber composite and an inner layer of a material other than a rubber;

a spout connected to the bladder and in communication with the inside of the bladder, wherein the spout comprises an output port and an fill port for filling the bladder with fluid;

a cap adapted to engage and close the fill port;

a tube having a first end connected to the output port of the spout and having a second end connected to a fluid delivery fitting.

17. (Original) The method of claim 16, wherein the bladder is flexible.

18. (Currently amended) The method of claim 16, wherein the ~~bladder comprises an inner layer of~~ comprises thermoplastic polyurethane.

19. (Original) The method of claim 16, wherein the cap is adapted to screw into the fill port.

20. (Original) The method of claim 16, wherein the spout has a width and a height, wherein the width is greater than height.

21. (Original) The method of claim 16, wherein tube is made of flexible plastic.

22. (Original) The system of claim 16, wherein the fluorinated rubber composite comprises a polyamide reinforcing layer and a thermoplastic polymer layer.

23. (Original) A bladder to store fluid, comprising:

an inner bladder layer of a thermoplastic polymer and an outer bladder encompassing the inner bladder, wherein the outer bladder layer comprises fluorinated rubber.

24. (Previously presented) The bladder of claim 23, wherein the inner bladder layer is comprised of thermoplastic polyurethane.

25. (Previously presented) The bladder of claim 23, wherein the outer bladder is comprised of a multiplayer laminate of the fluorinated rubber layer, a polyamide reinforcement layer, and a thermoplastic polymer layer.

26. (Original) The bladder of claim 23, wherein the bladder includes a hole to fill the bladder with liquid.

27. (Currently amended) A hydration system for providing fluid to a user, comprising:
a bladder configured to hold a fluid, wherein the bladder comprises an outer layer of chemically resistant composite and an inner layer of a material other than a rubber;
a spout connected to the bladder and in communication with the inside of the bladder, wherein the spout comprises an output port and a fill port for filling the bladder with fluid;
a cap adapted to engage and close the fill port;
a tube having a first end connected to the output port of the spout and having a second end connected to a fluid delivery fitting.

28. (Original) The bladder of claim 27, wherein the chemically resistant composite is a fluorinated rubber composite.
